## **EXPERIMENT NO 2**

Aim: To write Lexical analyzer specification for Pascal programming language.

```
Code:
-> addition.pas
Program Lesson1_Program3;
Var Num1, Num2, Sum: Integer;
Begin {no semicolon}
Write('Input number 1:');
Readln(Num1);
Writeln('Input number 2:');
Readln(Num2);
Sum := Num1 + Num2 + 2; {addition}
Writeln(Sum);
Readln;
End.
->lexical.l
% {
#include<stdio.h>
#include<string.h>
char ch_arr[100][100];
int n=0;
```

int check(char c[100])

for(int i=0;i<n;i++)

{

```
if(strcmp(ch_arr[i],c)==0)
                                     return(0);
                          }
                         return(1);
             }
int get_id(char c[100])
             {
                        for(int i=0;i<n;i++)
                                     if(strcmp(ch_arr[i],c)==0)
                                     return(i);
             }
% }

## **Output:**

**Conclusion :** From this experiment I learn about lex programming and how to design a lexical analyzer using C language and lex. This knowledge will be helpful in designing compiler.
